Ashwin Iyer

Boston, MA | (682) 239-9481 | iyer.ashw@northeastern.edu | linkedin.com/in/ashwin-hao-iyer | https://ashwiniyer.com

EDUCATION

Northeastern University **Expected May 2028**
Candidate for Bachelor of Science in Computer Science and Business Administration **GPA: 3.8**
Honors/Activities: Treasurer, NU Systematic Alpha; Dean's List
Relevant Coursework: Discrete Structures, Introduction to Databases, Program Design & Implementation, Business Statistics, Financial Management

TECHNICAL SKILLS

Languages: Python, C++, Java, Rust, JavaScript, TypeScript, SQL, Kotlin
Frameworks & Libraries: React, Next.js, Redux, Electron, TensorFlow, Keras, Pandas, NumPy
AI/ML: Open-weight models, Ollama, LM Studio, Unsloth, ComfyUI, MCP
Developer Tools: Git, AWS (EC2), PostgreSQL, Azure DevOps, IntelliJ, Eclipse, PyCharm, Xcode

WORK EXPERIENCE

Incoming Summer Analyst, Equity Trading **June 2027 – August 2027**
BlackRock | San Francisco, CA

Incoming Institutional Equity Co-op **January 2027 – June 2027**
Morgan Stanley | Derivatives Sales Trading | New York, NY

Global Risk & Analytics Co-op **December 2025 – June 2026**
Wellington Management | Boston, MA
- Regressed Blackstone private equity fund returns against public-market indices to estimate replicating index weights for a pooled vehicle supporting pre-seeded investments.
- Built a Python AI agent and MCP server for the risk portal, cutting token usage with local SQL caching, session persistence, and data-resolution filtering while automating stress tests and portfolio risk analysis.
- Developed post-shock equity-option exposure analytics and a Shapley decomposition tool that attributes changes in portfolio risk to positioning versus factor-level movements over time.

Software Engineering Intern **May 2025 – August 2025**
Zeal IT Consultants | Dallas, TX
- Developed the frontend for Trinity Industries' Asset Management System using React and Next.js.
- Increased team delivery capacity by 300% within one release cycle, accelerating the project timeline by 4 weeks.
- Decreased page load times by 94% by migrating from MobX to Redux and implementing server-side rendering.

PROJECTS

Event-Driven Implied Volatility Mispricing | *Python, Polygon.io* | Report January 2026 – March 2026
- Built a Python backtesting framework extending Gao, Xing & Zhang (2018) to identify event-driven implied volatility (IV) mispricings across 4 event types, processing 80,000+ option observations.
- Generated sector-level long/short straddle signals achieving a 63% win rate and 3.62% average return per trade out-of-sample on Technology earnings, and a 74% win rate with 10.81% ROI on FOMC events in 2025 testing.

Prediction Market Trading | *Rust, AWS* | Portfolio December 2025 – Present
- Built a real-time prediction market pricing model in Rust on AWS EC2 for low-latency API access.
- Achieved a 1.2 net adjusted Sharpe ratio, 40% total return, and 10% maximum drawdown over two months.

PM-Trading Desk | *Python, WebSockets* | GitHub September 2025 – Present
- Built a WebSocket prediction market trading app handling 500+ updates per second with sub-50ms order execution.
- Implemented a smart order router spanning Polymarket and Kalshi, achieving 2–5% average price improvement per trade through cross-exchange execution.
